

Dear Candidate,

Thank you for your interest in our company, team, and open position. CVs are interesting to us, as they help have a conversation. However, as in the immortal words of Linus Torvalds "*Talk is cheap, show me the code*", we have a coding task.

Things we value

1. **We start with understanding:** We expect you to think before you code. Demonstrate that you've understood the problem space, considered edge cases, and made deliberate choices about what to build and *why*. We value simple, elegant code that reads like a narrative, where the intent is clear and the reader isn't left guessing.
2. **We raise the bar through iteration:** Show us evidence of refinement. We value code that has clearly evolved through *thought, discovery, and revision*. Tell us what you tried, what you learned, and what you'd do differently with more time.
3. **We own our impact:** Take responsibility for your trade-offs. Explain *why* you chose one approach over another, acknowledge the limitations of your solution, and be prepared to discuss alternatives. We expect tests that read as documentation - a clear articulation of your code's *behaviour* and the contract it promises to fulfil.

Coding Kata

Please timebox 3-4 hours of your time to run a short kata and send us the resulting code. We are not expecting you to complete the exercise in the timebox, so think about what you want to convey to us in your code and focus on that.

Kata details

Banking Transaction Processor

Scenario:

Create a service that processes banking transactions for multiple accounts.

Requirements:

- Support accounts with unique IDs and balances.
- Allow deposit, withdrawal, and transfer operations.
- Validate operations to prevent overdrafts and invalid amounts.
- Maintain a ledger of transactions per account with timestamps.
- Provide APIs to query account balances and transaction histories.

Things we are looking for:

- It is highly desired that the code has been test driven.
- Clean code.
- Edge case consideration.
- Object orientation.
- Git history.

Final Remarks

1. Please share the private GitHub repository with the “*wealthcdio-apimanagement*” user, and email us the link, so that our team can check it.
2. Please read this letter (pdf) a couple of times.
3. If you feel stuck, please refer to the “Things we value” section. We deliberately put “Simple”, as the first thing in there.
4. If you are in doubt or pondering options, please refer to the “Things we are looking for” section.
5. Your code is expected to compile as a **minimum criterium**. If you skip something or make an important decision, or your code is not yet made compilable due to time constraint, please add a comment explaining the rationale in the README file. We will take them into consideration.

Good luck!
